INDEPENDENT MARKET MONITORING

BITCOIN BOTTOM WATCH

Evidence-family chart report

Market observations through 2026-10-14 (UTC)

Generated 15 October 2026 10:25 UTC

ON-CHAIN VALUATION / CYCLE STRUCTURE / DEMAND & LIQUIDITY / PRICE MOMENTUM / SENTIMENT

Research note: Indicator confirmation is not a prediction or a trading authorization. Missing independent data reduces confidence in bottom and early-bull inferences.

Executive evidence summary

This assessment differentiates evidence supporting a completed cycle bottom from evidence supporting an emerging sustained bull market. Technical momentum is ONE evidence family, not multiple independent confirmations.

Evidence family	Bottom / early-bull interpretation
On-chain valuation	UNVERIFIED: no defensible synchronized MVRV, realized price or holder metrics
Cycle structure	Pi Cycle Bottom: no new crossover; absent signal does not rule out bottom
Demand / liquidity	UNVERIFIED: no validated latest ETF-flow time series / stablecoin demand
Price / momentum	Confirmed monthly RSI bullish crossover; EMA ribbon not fully ordered
Sentiment	53 / Neutral (overlay only)

Observed BTC/USD daily close: **US$81,574.32** on **2026-10-14**. Last completed week: 2026-10-11; last completed month: 2026-09-30.

Overall assessment: Price/momentum evidence is constructive, but on-chain valuation and sustained demand cannot be assessed with sufficient confidence. Neither a definitive completed bottom nor an early bull market is independently confirmed by this report.

Tranche discipline: No additional borrowed-funds tranche is justified by technical indicators alone. Bottom/bull probabilities are not quantified without an adequate independent evidence base.

Data: 15 October 2026 10:25 UTC. Source: Bitstamp daily OHLC published and validated by GitHub collector.

Family 1 | On-chain valuation

STATUS: NOT VERIFIED - no numerical MVRV or realized-price chart has been published.

MVRV Z-Score, realized price, realized profit/loss and long-term-holder activity require dated, internally consistent on-chain observations. No reliable synchronized price/valuation series is available in this automated report.

How to interpret the missing indicators

MVRV Z-Score compares market value with realized cost basis after volatility normalization. Lower readings have historically accompanied more depressed valuation; recovery from low levels can support bottom formation. Realized price estimates holders' on-chain cost basis. Accumulation, capitulation and Sell-Side Risk help distinguish a true cycle reset from temporary rallies.

Bottom or early-bull assessment

INCONCLUSIVE. Without independently verified valuation and holder activity, momentum strength cannot establish that Bitcoin is attractively priced or that long-term holders are accumulating.

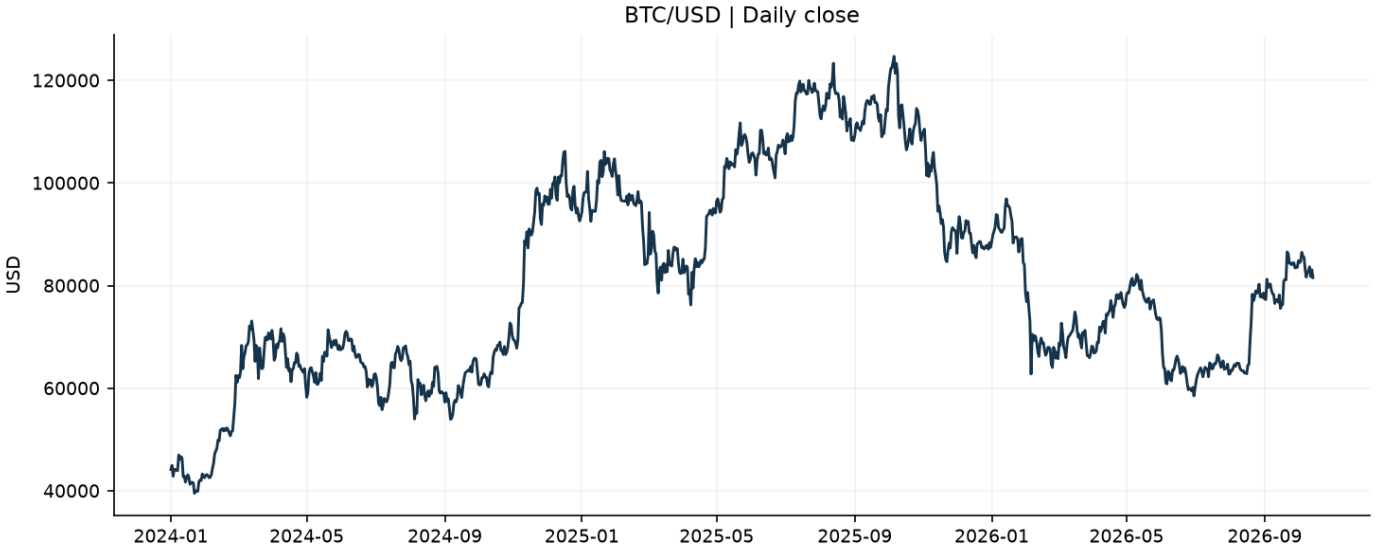

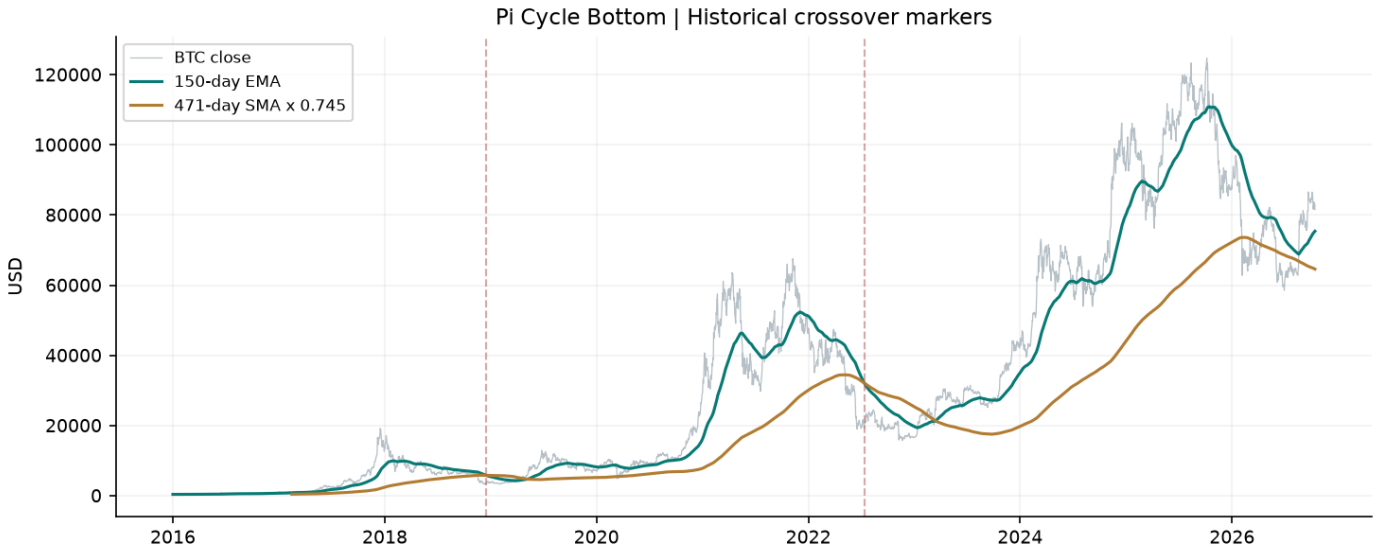

Chart: verified market-price context ONLY, not a proxy for MVRV or realized price. Source: Bitstamp daily OHLC.

Family 2 | Cycle / structural

How to read this chart

The green curve is the 150-day EMA, and gold is 0.745 x the 471-day SMA. A Pi Cycle Bottom event is recorded only when the adjusted long average crosses ABOVE the shorter EMA. Dashed markers show historical occurrences; they are not forward predictions.

Latest verified values (2026-10-14): 150-day EMA **US$75,392**; adjusted 471-day SMA **US$64,595**. New bottom crossover: **NO**.

Bottom or early-bull assessment

No new Pi Bottom crossover. This does not deny a completed bottom: the indicator is episodic, can lag, and may not trigger during every constructive market regime. It offers no fresh bottom confirmation today.

Source: Bitstamp standard BTCUSD daily closes, 150-day EMA and 471-day SMA x 0.745; historical dates and latest values validated to published JSON.

Family 3 | Demand / liquidity

STATUS: INSUFFICIENT CURRENT DATA - no ETF-flow or stablecoin chart has been fabricated.

How to read demand charts

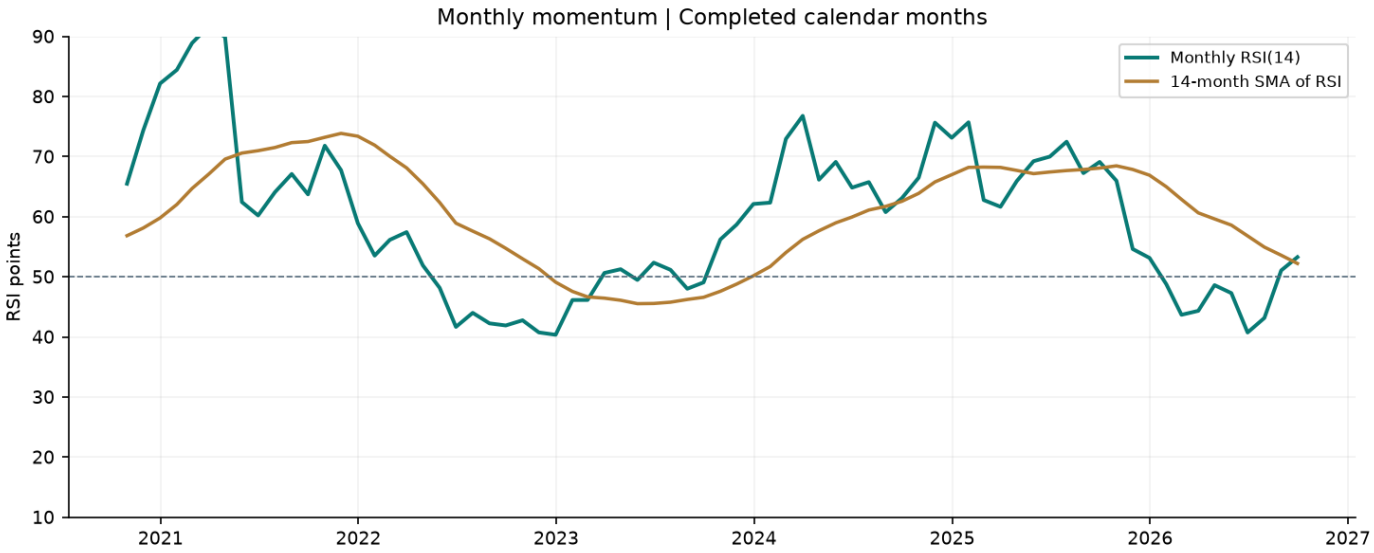

Persistent positive net US spot ETF flows can indicate fresh capital entering Bitcoin; persistent outflows can contradict a new bull thesis. Confirm alongside spot trading volume, stablecoin growth, exchange flows and evidence that rallies are not primarily derivatives short covering.

Bottom or early-bull assessment

INCONCLUSIVE. Without a fresh, adequately long and verified net-flow series, positive momentum cannot be attributed to new spot demand. This family must not be counted as confirming an early bull market.

Family 4 | Price and momentum

How to read monthly RSI

The teal line is 14-period Wilder RSI on monthly BTC closing prices; gold is the 14-month simple average of RSI. A confirmed monthly bullish crossover requires the completed RSI bar to close above the RSI average after previously being at or below it. A crossover supports momentum recovery, not necessarily deep valuation.

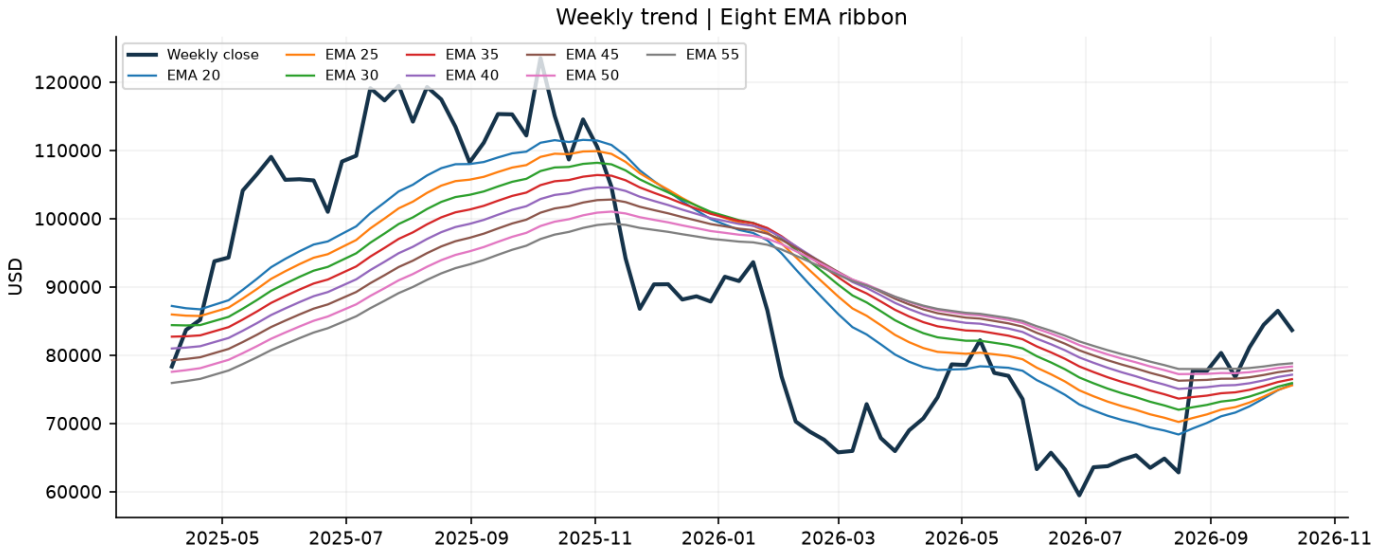

Completed month 2026-09-30: RSI **53.27** vs RSI-SMA **52.21**; bullish crossover: **YES**.

Bottom or early-bull assessment

Momentum recovery is supported by a completed monthly RSI crossover. This improves the technical case for an early bull, but cannot independently confirm the cycle bottom.

Family 4 | Weekly trend confirmation

How to read the EMA ribbon

A strictly bullish ordering requires EMA20 > EMA25 > EMA30 > EMA35 > EMA40 > EMA45 > EMA50 > EMA55. BTC closing above every EMA is constructive but insufficient for a fully ordered bullish ribbon. Watch slope, persistence and widening separation.

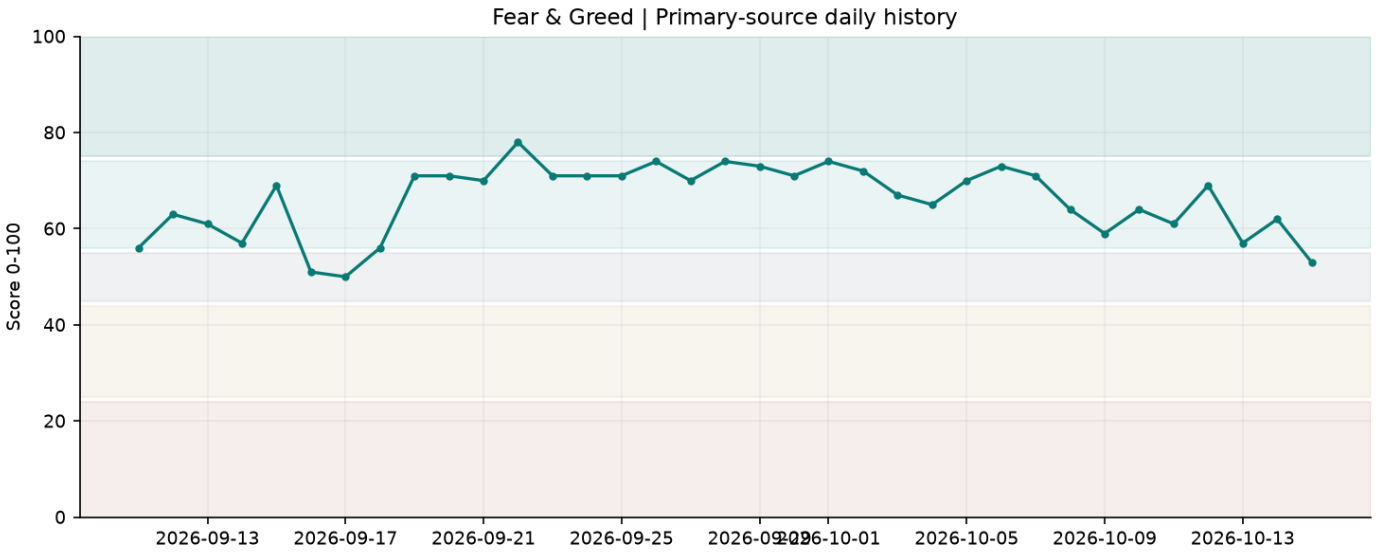

Last completed weekly close (2026-10-11): **US$83,679.01**. Above all eight averages: **YES**. Fully bullish ordering: **NO**.

Bottom or early-bull assessment

Price above the weekly EMA ribbon supports improving trend, but incomplete EMA ordering means the stronger structural confirmation has not yet arrived. Treat this together with monthly RSI as ONE momentum family.

Sentiment overlay | Fear & Greed

Latest verified value: **53/100 (Neutral)**, 2026-10-15. Source: Alternative.me primary API.

How to read it

Shaded bands correspond to extreme fear (0–24), fear (25–44), neutral (45–55), greed (56–74) and extreme greed (75–100). Look for multiweek shifts; no single sentiment reading identifies a durable bottom.

Bottom or early-bull assessment

Neutral sentiment supplies little standalone confirmation either way.

Sources and indicator integrity

All technical time series use verified daily Bitstamp BTC/USD standard closes, not Heikin Ashi. The daily series is checked for continuity and the month/week series contain only completed bars.

Published reference: https://raw.githubusercontent.com/tvella23/B-Bottom-Watch/main/latest.json

Pi Cycle: EMA(150, daily close) versus 0.745 x SMA(471, daily close); bullish crossover of the long adjusted SMA above the short EMA is the bottom event. RSI: Wilder(14) on completed monthly closes, compared with a simple moving average over 14 RSI observations. EMA ribbon: 20/25/30/35/40/45/50/55 on completed Sunday-ending weekly closes.

The report does not silently replace missing on-chain, ETF, stablecoin or derivatives statistics with stale web previews, a different data provider or illustrative numbers. Only dated, valid primary-source observations are plotted.

Future changes to calculated indicator methodology, source and aggregation rules require a revalidation against trusted chart references before publication.
